

For the following dependency graphs, assume each strand (box) runs in one time unit.
Assuming there are 2 processors, what is the smallest number of time unit that the computation could take. What is the maximum number of time units the computation could take. Justify your answer.

A.

worst

\processor – time units>>	1	2	3	4	5
1	a	d	b	e	f
2	-	c	-	-	-

best

\processor – time units>>	1	2	3	4
1	a	b	e	f
2	-	c	d	-

B.
Worst

W/processor – time units>>	1	2	3	4	5	6	7
1	a	c	f	b	e	h	i
2	-	d	g		-		-

Best

W/processor – time units>>	1	2	3	4	5
1	a	b	e	h	i
2	-	d	f	g	c

C.
Worst

V\processor – time units>>	1	2	3	4	5	6
1	a	e	h	i	c	f
2	-	b	d	g	-	-

Best

V\processor – time units>>	1	2	3	4	5
1	a	e	c	f	i
2	-	d	g	h	b
